Transforming **Wild Omission** into a true *Rust*-styled tactical survival experience requires a structured modernization of its item economy, building logic, PvE threats, and environmental systems.

Phase 1: Core Economy, Primitives, and Basic Combat

Focus: Establishing the foundational resource loop, basic tool tiers, and hitscan/projectile combat.

- **Item Pool Expansion:**
    - **Resources:** Implement raw nodes for Wood, Stone, Metal Ore, and High-Quality Metal (HQM), alongside gathering derivatives like charcoal, sulfur, and animal fat.
    - **Tools & Weapons:** Introduce tiered tool assets (Stone Hatchet/Pickaxe up to Metal variants) and primitive weapons (Hunting Bow, Crossbow, Handmade Revolver, and primitive spear variants).
    - **Ammo Types:** Wooden arrows, bone arrows, and basic pistol/rifle cartridges tied to workbench crafting tiers.
- **Building Block Tiering:**
    - Implement a 4-tier stability and upgrade structure: **Twig** (decay-prone, breakable by hand tools) $\rightarrow$ **Wood** $\rightarrow$ **Stone** $\rightarrow$ **Sheet Metal / Armored**.
- **Immediate Mechanics Verification:** Ensure resource yield scaling works correctly when harvesting nodes with corresponding tool tiers.

Phase 2: Industrial Crafting, Electricity, and Base Fortification

Focus: Progression gates, automated power grids, and advanced defense mechanics.

- **Item Pool Expansion:**
    - **Workbenches:** Tier 1, Tier 2, and Tier 3 research benches to gate technological progression and blueprints.
    - **Deployables:** Code locks, key locks, tool cupboards (TC) for upkeep/territory privilege, large wooden boxes, and furnace variants (Small and Large oil/metal refineries).
    - **Electricity System:** Generators, switches, splitters, low-voltage wiring, and automated defense traps (Auto-Turrets and Shotgun Traps).
- **Base Defense Mechanics:**
    - Implement a **Tool Cupboard Upkeep System** where structures consume stone, metal, and wood over time based on building tier; failing to stock resources triggers structural decay.
- **Verification Check:** Confirm that placing a Tool Cupboard restricts enemy building placement within its radius and properly taxes stored resources every 24 hours.

Phase 3: Advanced Ballistics, High-Tier Loot, and World Monuments

Focus: End-game player progression, monuments, and intense PvP/PvE loops.

- **Item Pool Expansion:**
    - **Military-Grade Firearms:** Assault Rifles (AK-style), Bolt-Action Rifles, Submachine Guns, and C4 / Rocket Launchers for raiding.
    - **Medical & Clothing:** Syringes for instant healing, bandages, heavy tactical armor sets, hazmat suits (for radiation zones), and burlap/road-sign clothing modifiers.
    - **Crops & Consumables:** Hemp (for cloth), corn, and pumpkins with genetic crossbreeding mechanics for high-yield fiber and calorie production.
- **World Monuments & Rad Towns:**
    - Procedurally place static monuments (Airfield, Power Plant, Military Tunnels) guarded by automated security systems, containing elite loot crates and high-tier component spawns.
- **Verification Check:** Test that radiation zones drain player health unless appropriate hazmat or anti-radiation gear is worn.

Phase 4: Expanded Weather Physics and Advanced AI (NPCs & Scientists)

Focus: Dynamic environmental hazards merging with aggressive, player-mimicking combat AI.

- **Expanded Weather & Environmental System:**
    - Build upon Wild Omission's existing severe weather by adding torrential acid rain, blinding sandstorms/blizzards, and freezing temperature mechanics that require clothing insulation ratings and campfires to counter.
    - Integrate structural destruction physics where sustained high winds or localized tornadoes actively rip away unsecured Twig/Wood roof and wall panels.
- **Advanced AI Implementation (Rust-Style Scientists & Heavy Patrols):**
    - **Behavior Trees:** Program AI entities to utilize cover, blind-fire around corners, throw fragmentation and smoke grenades, heal using medical syringes when low on health, and flank human targets.
    - **Patrol Paths:** Introduce autonomous roaming threats—such as patrol helicopters scanning for unauthorized base build-ups or heavy armor squads defending high-tier monuments.
- **Verification Check:** Verify that AI units accurately trace line-of-sight, react to sound propagation (gunshots/footsteps), and correctly execute cover-seeking routines during firefights.
